Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

NADPH-ferrihemoprotein reductase (EC 1.6.2.4) - Aspergillus niger
N;Alternate names: NADPH-cytochrome P450 oxidoreductase
C;Species: Aspergillus niger
C;Date: 10-Sep-1999 #sequence_revision 10-Sep-1999 #text_change 03-Jun-2002
C;Accession: S38427
R;Van den Brink, J; van Zeijl, C; van den Hondel, C; van Gorcom, R.
submitted to the EMBL Data Library, October 1993
A;Description: Cloning and characterization of the NADPH cytochrome P450 oxidoreducta
A;Reference number: S38427
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A; Introns: 595/3

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      οy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NAPH-ferrihemoprotein reductase (EC 1.6.2.4) - guinea pig
NAlternate names: NADPH-cytochrome P450 oxidoreductase
C; Species: Cavita porcellus (guinea pig)
C; Date: 03-reb-1994 #sequence_revision 03-reb-1994 #text_change 03-Jun-2002
C; Accession: S27158; S38510
C; Accession: S27158; S38510
C; Accession: S27158; S38510
C; Accession: S27158; S38510
C; Accession: S27158; MUD: 93041995; PMD: 1420354
A; Reference number: S27158; MUD: 93041995; PMD: 1420354
A; Recession: S27158
A; Molecule type: mRNA
A; Reserve mumber: S27158; MUD: 93041995; PMD: 1420354
A; Note: the species identification has been revised in reference S38510
A; Note: the species identification has been revised in reference S38510

A; Residues: 'PTHDG', 14-39,'NY', 42-52,'N', 54-81 <BLA>
A; Note: the order of the first four residues was not determined
A; Note: the amino end of the mature protein is acetylated
C; Comment: This enzyme, a membrane-bound flavoprotein containing one molecule each of
C; Comment: This enzyme, a membrane-bound flavoprotein reductase; flavodoxin homology; NADPH-ferrihemo
C; Reywords: acetylated amino end; electron transfer; FAD; flavoprotein; FMN; membrane
F; 78-56,Domain: membrane-bound #status predicted <FMN>
F; 78-228/Domain: NADPH-ferrihemoprotein reductase homology <FEH>

        Biochemistry 40:13456-13465(2001).
-!- FUNCTION: FUNCTIONS AS A FATTY ACID MONOOXGENASE. CATALYSES HYDROXYLATION OF MEDIUM AND LONG-CHAIN FATTY ACIDS AT OMEGA-1, OMEGA-2 AND OMEGA-3 POSILIONS, WITH OPTIMUM CHAIN LENGTHS OF 14-16 CARBONS (LAURIC, MXRISTIC, AND PALMITIC ACIDS). THE REDUCTASE DOMAIN IS REQUIRED FOR ELECTRON TRANSFER FROM NADP TO CYTOCHROME
                                                                                                                                                                                                                                                                                                                                                                                        R InterPro; IPR001308; Cytochrome_P450.

Biol. Chem. 257:5929-5938(1982).

1- BIOL. CHEM. 257:5929-5938(1982).

1- CUNCTION: THIS ENZYME IS REQUIRED FOR ELECTRON TRANSFER FROM NADP TO CYTOCHROME PASO IN MICROSOMES. IT CAN ALSO PROVIDE ELECTRON TRANSFER TO HEME OXYGENASE AND CYTOCHROME B5.

1- CATALYTIC ACTIVITY: NADPH + 2 ferricytochrome = NADP(+) + 2

-1- FUNCTION: THIS ENZYME IS REQUIRED FOR ELECTRON TRANSFER FROM NATION TYOLOGHNOMED P450 IN MAICROSOMES. IT CAN ALSO PROVIDE ELECTRON TRANSFER TO HEME OXYGENASE AND CYTOCHROME B5.

-1- CATALYTIC ACTIVITY: NADPH + 2 ferricytochrome = NADP(+) + 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  -i- SUBCELLULAR LOCATION: ENDOPLASMIC RETICULUM. ANCHORED TO THE ER MEMBRANE BY ITS N-TERMINAL HYDROPHOBIC REGION.
-i- SIMILARITY: THE FMN-BINDING DOMAIN IS RELATED TO BACTERIAL FLAVODOXINS. THE FAD DOMAIN APPEARS HOMOLOGGUS WITH FERREDOXIN NADP+ REDUCTASE, NADH CYTOCHROME B5 REDUCTASE, AND GLUTATHIONE REDUCTASE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Eukaryota; Fungi; Ascomycota; Saccharomycotina; Saccharomycetes;

"Structural comparison between the trout and mammalian hydrophilic
"Structural comparison between the trout and mammalian hydrophilic
domain of NADPH-cytochrome P-450 reductase.";
J. Chromatogir A 397:123-136(1987).
-1- FUNCTION: THIS ENZYME IS REQUIRED FOR ELECTRON TRANSFER FROM NADP
TO CYTOCHROME P450 IN MICROSOMES. IT CAN ALSO PROVIDE ELECTRON
TRANSFER TO HEME OXYGENASE AND CYTOCHROME B5.
-1- CATALYTIC ACTIVITY: NADPH + 2 ferilcytochrome = NADP(+) + 2

-i- FUNCTION: PRODUCES NITRIC OXIDE (NO) WHICH IS A MESSENGER MOLECULE WITH DIVERSE FUNCTIONS THROUGHOUT THE BODY. IN THE BRAIN AND PERIPHERAL NERVOUS SYSTEM, NO DISPLAYS MANY PROPERTIES OF A NEUROTRANSMITTER. ISOFORM NNOS MU MAY BE AN EFFECTOR ENZYME FOR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DILLIC OXIGE + N NADP(+).

COFACTOR: HEME. BINDS ONE MOLE EACH OF FAD AND FMN. ALSO REQUIRES TERAHYDROBIOPTERIN (BH4) WHICH MAY STABILIZE THE DIMERIC FORM OF THE ENZYME (BY SIMILARITY).

THE ENZYME REGULATION: STIMULATED BY CALCIUM/CALMODULIN. INHIBITED BY N-NOS-INHIBITING PROTEIN (PIN) WHICH MAY PREVENT THE DIMERIZATION
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              NOSI_MOUSE STANDARD; PRT; 1429 AA.

                                                                                                                                                                                                               NOS1_RAT
                                                                                                                                                                                                                             g
         -1- SUBURIT: HOMODIMER (BY SIMILARITY).
-1- SUBCELLULAR LOCATION: IN SKELETAL MUSCLE, NNOS IS LOCALIZED BENEATH THE SARCOLEMAA OF PAST-TWITCH MUSCLE FIBER BY ASSOCIATING WITH THE DYSTROPHIN GLYCOPROTEIN COMPLEX.
-1- ALTERNATIVE PRODUCTS: 5 ISOFORMS; N-NOS-1 (SHOWN HERE), N-NOS-2, NNOS BETA, NNOS GAMAM AND NNOS MU/MUSCLE-SPECIFIC; ARE PRODUCED BY ALTERNATIVE SPLICING.
-1- TISSUE SPECIFICITY: WIDELY EXPRESSED IN THE NERVOUS SYSTEM: EXPRESSED IN CEREBRUM, OLFACTORY BUILD, HIPPOCAMPUS, MIDBRAIN, CEREBELLUM, PONS, MEDLIAA OBLONGATA, AND SPINAL CORD. ALSO FOUND IN SKELETAL MUSCLE, FIBERS, AND IN SPLEN, HERRY TY REGULATED.
IN SKELETAL MUSCLE, FIBERS, AND IN SPLEN, HERRY TY REGULATED.
IN SKELETAL MUSCLE, FIBERS, AND IN SPLEN, HERRY TY REGULATED.
IN SKELETAL MUSCLE, FIBERS, AND IN SPLEN, HERRY TY REGULATED.
IN STATEM, NNOS BETA AND GAMMA OCCUR IN A REGION-SPECIFIC MANNER IN THE BRAIN AND NNOS BETA EXPRESSION IS DEVELOPMENTALLY REGULATED.
INNOS MU IS ONLY FOUND IN MATURE SKELETAL AND CARDIAC MUSCLES.
-1- DOMAIN: THE DIS DOMAIN IN THE N-TERMINAL PART OF THE NEURONAL ISOFORM PARTICIPATES IN PROTEIN-PROTEIN INTERACTION, AND IS RESPONSIBLE FOR TARGETING NNOS TO SYMAPTIC MEMBRANES IN MUSCLES.
-1- DOMAIN: THE DIS DOMAIN IN THE N-TERMINAL PART OF THE NEURON AND IS RESPONSIBLE FOR TARGETING NNOS TO SYMAPTIC MEMBRANES IN MUSCLES.
-1- DISEASE: IN MOX MICE (MOUSE MODEL OF DYSTROPHINOPATHY) THE DYSTROPHIN COMPLEX IS DISRUPTED AND NNOS IS DISPLACED FROM SARCOLEMMA AND ACCUMULATES IN THE CYTOSOL.
-1- SIMILARITY: BELONGS TO THE NOS FAMILY.
-1- SIMILARITY: CONTAINS I PDE/PHR DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                    This SWISS-PROT entry is copyright.                                                             THE ENZYME (BY SIMILARITY)

-I- ENZYME (BY SIMILARITY)

-I- ENZYME (BY SIMILARITY)

N-NOS-INHIBITING PROTEIN (PIN) WHICH MAY PREVENT THE DIMERIZATION OF THE PROTEIN (PIN) WHICH MAY PREVENT THE DIMERIZATION OF THE PROTEIN (PIN) WHICH MAY PREVENT THE DIMERIZATION OF THE PROTEIN (BY SIMILARITY).

-I- SUBGUILT: HOMODIMER (BY SIMILARITY).

-I- SUBGELLULAR LOCATION: IN SKELETAL MUSCLE, NNOS IS LOCALIZED BENEATH THE SARCOLEMMA OF FAST-TWAITCH MUSCLE FIBER BY ASSOCIATING WITH THE DYSTROPHIN GLYCOPROTEIN COMPLEX (BY SIMILARITY).

-I- ALTERNATIVE PRODUCTS: 3 ISOFORMS; N-NOS-1 (SHOWN HERE), N-NOS-2 AND PNNOS; ARE PRODUCED BY ALTERNATIVE SPLICING.

-I- TISSUE SPECIFICITY: ISOFORM N-NOS1 IS EXPRESSED IN BRAIN. ISOFORM PNNOS; BADDER AND LIVER, AND IS EXPRESSED IN THE PELLAR NNOS IN THE PELLOL.

MUSCLE, AND COEXISTS WITH THE CEREBELLAR NNOS IN THE PELVIC MUSCLE, AND SARLETAL NUSCLE, AND SARLETAL NUSCLES 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SIMILARITY).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              780
                                                                                                                                                                                                                                                                       9
                                         The present sequence represents a cytochrome P450 monooxygenase. The specification describes a modified cytochrome P450 monooxygenase which can oxidize at least one of the following types of substrates: optionally substituted mono- or poly-cyclic aromatic heterocyclics containing nitrogen, sulpiur or poly-cyclic aromatic heterocyclics poly-cyclic aromatics; linear or branched alkanes or alkenes; or optionally substituted cycloalkanes or cycloalkenes. The modified cyclohrome P450 monooxygenase are specifically used to oxidize indole to indigo and indorubicin. However, they may be used to oxidize many other substrates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 TIKEMPOPKTFGELKNLPLLNTDKPVQALMKIADELGEIFKFEAPGRVTRYLSSORLIKE

This invention describes a novel electron donor system (M1) that transfers electrons to an enzyme with redox properties comprising an inorganic, not electrode-bound, electron sink and a mediator which enable the electron transfer. The invention also describes (1) transferring (M2) oxygen to a hydrocarbon containing hydrogen donor molecule is in a reaction mediator where the hydrogen donor molecule is in a reaction mediator where the cransferring enzyme and (M1) in the presence of oxygen and incubating under suitable reaction conditions; (2) the enzymatic production (M3) of terminally or subterminally hydroxylated (position omega-1 to omega-4) catty acids comprising; (i) mixing a hydroxylatable fatty acid or fatty acid derivative in the presence of (M1) and cytochrome P450 monooxygenase; and (ii) isolating the hydroxylated product; (3) a concactor useful for the production of omega-hydroxylated fatty acids as described in (2); and (4) detecting (M4) fatty acid-monooxygenases
                                                                                                                                                                                         1020

         label in (M1); and (ii) qualitatively or quantitatively detecting the signal. The invention is useful for the production of omega-hydroxylated fatty acids and the detection of fatty acid monoxygenases. The invention provides an alternative electron donor system of enzymes with redox properties that is cheaper and more efficient, where the enzyme

This invention describes a novel modified cytochrome P450 (I) having, as a result of site-specific mutagenesis of its substrate-binding domain, an altered substrate profile, relative to the wild-type, when used for terminal and/or subterminal enzymatic hydroxylation of aliphatic carboxylic acids. The invention also describes (1) nucleic acid (II) encoding (I), and its complement, (2) expression assette (EC) containing (II) and control elements; (3) a vector containing at least one EC; (4) recombinant microorganisms transformed with at least one vector of (3); and (5) enzymatic production of terminally and/or subterminally and (5) enzymatic production of terminally and/or subterminally and (4), or isolated (I). (I), and recombinant cells that express them, are used to produce hydroxylated aliphatic carboxylic acids or their derivatives (esters and amides). (I) have altered substrate specificity, especially for hydroxylation of 8-12C fatty acids at the omega-1, 2 and/or 3 positions, and may also have increased reactivity and/or

                                                                                                                                                                                                                                                                                                                                                                                                                                                 Process for oxidizing acyclic or cyclic terpenes, cycloalkenes, or derivatives for preventing or treating infection in human or animal body comprises mutant haem-containing enzyme which has substitution of amino acid in the active site -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The specification describes a process for oxidizing an acyclic or cyclic terpene, a cycloalkene, or a derivative. The process comprises oxidizing the compound with a mutant haem-containing enzyme which comprises a substitution of an amino acid in the active site by an amino acid with a less polar side-chain. The process is useful for oxidizing an acyclic or cyclic terpene, a cycloalkene, or their derivatives. The process is also useful for producting an oxidation product useful for preventing or treating infection in a human or animal body. The present sequence represents the amino acid sequence for use in the process of the invention.

Cytochrome P450 monooxygenase; oxidization; indole; indigo; indorubicin
                                                                                                                                                                                                                                                                          The present sequence represents a cytochrome P450 monooxygenase. The specification describes a modified cytochrome P450 monooxygenase which can oxidize at least one of the following types of substrates: optionally substituted mono- or poly-cyclic aromatic heterocyclics containing nitrogen, sulphur or oxygen; optionally substituted mono- or poly-cyclic aromatics; linear or branched alkanes or alkenes; or optionally substituted cycloalkanes or cycloalkenes. The modified cytochrome P450 monooxygenase are specifically used to oxidize indole to indigo and indorubicin. However, they may be used to oxidize many

                                                                                                                                                                                             The present sequence represents a modified cytochrome P450 monooxygena The specification describes a modified cytochrome P450 monooxygenase which can oxidize at least one of the following types of substrates: optionally substituted mono- or poly-cyclic aromatic heterocyclics containing nitrogen, sulphur or oxygen; optionally substituted mono- optionally substituted mono- optionally substituted cycloalkanes or cycloalkenes; or optionally substituted cycloalkanes or cycloalkenes; or optionally substituted cycloalkanes or cycloalkenes. The modified cycochrome P450 monooxygenase are specifically used to oxidize indole to indigo and indorubicin. However, they may be used to oxidize many
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DIKVMNDLVDKIIADRKASGEOSDDLLTHMLNGKDPETGEPLDDENIRYQIITFLIAGHE

The specification describes a modified cytochrome P450 monooxygenase which can oxidize at least one of the following types of substrates: optionally substituted mono or poly-cyclic aromatic heterocyclics containing nitrogen, sulphur or oxygen; optionally substituted mono or poly-cyclic aromatics; linear or branched alkanes or alkenes; or optionally substituted cycloalkanes or cycloalkanes to indige and indorublein. However, they may be used to oxidize many
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   309 KQLKYVGMVLNEALRLWPTAPAFSLYAKEDTVLGGEYPLEKGDELMVLIPQLHRDKTIWG 368
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      this sequence does not appear in the specification; it was created
                                                                                                                            indole; indigo; indorubicin.

                                                                                                                                                                                                                                                                          The protein is a fusion of bovine adrenal cytochrome P450 17-alpha and Bacilius megaterium-derived cytochrome P450 BM-3. The fusion protein has the monoatomic oxygenation activity of the former and the reductivity supplying activity of the latter. Plasmid p(alphaBMI),

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                                                                                                                                                                                                                The present invention relates to a process for enzymatically oxidising the halogenated aromatic compounds such as 1,2-dichlorobenzene, 1,2,4-trichlorobenzene, 3,3'-dichloroblenzene, 2,2',4,5',5'-pentachloroblenzene, 3,3'-dichloroblenzene compounds and its physiolophenyl. The process comprises treating the polluted environment with a monooxygenase enzyme, P450cam, and its physiological electron transfer partners, putidaredoxin and putidaredoxin reductase, are used to oxidise the halogenated aromatic compounds. Also mutents of the monooxygenase enzyme with substitutions in the active site have enhanced oxidation activity. The process and the transgenic plant or animal which expresses the monooxygenase enzyme are used for detoxifying the environment polluted with the halo aromatic compounds. The present sequence is a Bacillus megaterium monooxygenase enzyme, P450LNH-3, which is homologous to the monooxygenase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      180

present sequence represents a B, megaterium P-450BM-3 peptide fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The primers given in AAO79915-19 were used for the PCR amplification of A. niger ATCC 1015 chromosomal DNA. These degenerate primers are based on conserved sequences in known cytrochrome-P450-oxidoreductases. The DNA sequence of an isolated clone, given in AAO79914, encodes a cytochrome-P450-oxidoreductase having the sequence given in AAR66738.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Recombinant DNA mol. encoding cytochrome P450 oxido:reductase esp. isolated from filamentous fungi, useful for increasing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 693;
                                                                              Length 17;
                                                                                                                      Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention provides an isolated, mutated Monoamine Oxidase B (MAO B) enzyme having at least one amino acid substitution for wild-type amino acids in a MAO B active site, the wild-type amino acid residues selected from Phe423, Glu427 and Thr428. A plasmid containing the DNA encoding the mutated MAO B and regulatory elements can be used for the recombinant regulation of the enzyme. The mutated MAO B enzyme is useful for indirect regulation of cellular neurotransmitters and vasoamines, as the substitutions reduce MAO B's activity and alters its pH profile. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   particular, these are useful for diagnosing or determining susceptibility of a subject to a disease associated with altered levels of reductase polypeptide or mRNA expression. In particular, these are useful for diagnosing or determining susceptibility of a subject to a disease associated with altered levels of reductase polypeptide. Diseases which may be treated by methods using the reductase include cancer, and the sequences may be used in methods for drug bioactivation. The polypeptides and polynucleotides may also be used as vaccines to protect an individual against these diseases. The polypeptide or its fragments are also useful as immunosens to produce antibodies that are immunosecific for the reductase polypeptides. The polynucleotide sequences may also be used in chromosome localization studies and tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to DNA sequence AAF29129 which encodes a human reductase represented in AAB49682. The DNA sequence shows homology with nucleotide sequences of cytochrome p450 reductases and nitric oxide synthases. The protein is related to members of the FNR gamily of flavoproteins. This reductase gene maps to human chromosome 9. The reductase polypeptide and polynucleotide are useful in screening assays, particularly as diagnostic reagents for detecting abnormally decreased or

2-(4-hydroxyphenoxy) propionic acid (I) from 2-phenoxypropionic acid (POBS) or its salts. The method comprises a microorganism containing at least one of the genes contained within a Beauveria bassiana genomic sequence of 11292 bp (I), with two open reading frames. (I) is useful as a herbicide intermediate. Microorganisms containing multiple copies of (I) have significantly increased hydroxylation rates. This sequence represents the Beauveria bassiana POPS reductase described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; cytochrome P450 monooxygenase; cytochrome P450 reductase; NPR; pigment production; indole; dye; cosmetic industry; marker.

```
The present sequence is cytochrome P450 reductase. The invention relates to a method for producing pigment using cells containing cytochrome P450 sequences. It involves the use of genetic material encoding a cytochrome P450 protein or a functional derivative or homologue of it in the generation of a genetically modified cell. The cell has the capacity to produce a pigment in the presence of indole, or a precursor, analogue or derivative of indole, upon expression of the genetic material. Pigment from plant or plant material is useful in the dye or cosmetic industry or as commercial tags or as markers for transformation of microbial, plant or animal cells.
                                                                 Generation of genetically modified cell to produce pigment
                                                                                                                  Claim 39; Page 145-148; 178pp; English.

Patent No. 5908756
GENERAL INFORMATION:
APPLICANT: Supder, Solomon H.
APPLICANT: Jaffrey, Samite R.
TITLE OF INVENTION: Protein Inhibitor of Neuronal Nitric TITLE OF ENVENTION: Oxide Synthase
NUMBER OF SEQUENCES: 16
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0; Indels
